Jackson-Pratt Drain Care

After surgery, you will have a drain(s) called a Jackson-Pratt (JP) drain. This device suctions and collects fluid from your surgical area. The drain promotes healing and recovery, and reduces the chance of infection. The drain will be in place until the drainage slows enough for your body to reabsorb fluid on its own. While you are hospitalized the nursing staff will care for the drain and teach you to continue to do so at home. You may be prescribed antibiotics. Please complete your course as instructed by your provider.

How to Empty your JP Drain

- Wash your hands thoroughly before emptying your drain(s).
- Have the plastic measuring cup from the hospital ready to collect and measure the drainage.
- Unpin the drain from your clothing.
- Open the top of the drain. Turn the drain upside down and squeeze the contents of the bulb into the measuring cup. Be sure to empty the bulb as completely as possible.
- Use the chart to record the amount of drainage twice a day or any time the bulb is full. Record the total for 24 hours. If you have more than one drain, remember to record the drainage from each drain separately. To prevent infection, do not let the stopper or top of the bottle touch the measuring cup or any other surface. Use one hand to squeeze all of the air from the drain. With the drain still squeezed, use your other hand to replace the top. This creates the suction necessary to remove the fluids from your body.
- Pin the drain back on your clothing to avoid pulling it out accidentally.
- Wash your hands again. Remember to wash your hands before and after the procedure to reduce the risk of infection.

If you had reconstructive surgery, you will have a biopatch and tegaderm dressing to the drain site. The dressing and patch should be changed every three days. You will receive these supplies before being discharged from the hospital. To change the patch, wash your hands and gently remove the old dressing. Next, place the new patch around the tubing of JP drain near the insertion site be sure the white sponge side is facing down on the skin and the blue side should be facing out. Finally, place clear plastic dressing over the top of the sponge.
